

PSY 341 – spring 2014

Dr. Anderson

Project 2 – Personal Profile Analysis – Due 6 May

In this project you will need to reflect on the measures used in class and how they relate to your own personality. You will need to select 4 measures from section A (the objective measures). If you elect to use the PAQ, all scores from the PAQ should be used as one selection and then 3 other measures should also be used. You also need to select 2 from section B.

Each reflection will include your interpretation of the actual scores and then the self-reflection of the results. Basically, what do the results say about you in comparison to your class mates and do you agree or disagree with those results and why or why not.

For the objective measures you should refer to the information below and how it portrays your position on that dimension. Then provide a self-reflection of whether or not you agree with the results of the surveys.

A. Data for the inventories you took in class:

Measure	mean	std dev.	Possible range
Locus of Control	14.24	2.19	0-20
Type A/B	7.86	2.89	0-21
Tolerance for Ambiguity	91.32	19.98	22-154
Need For Closure (amb sub-scale)	38.74	5.65	9-54
Bem	-1.76	13.37	-60 to 60
PAQ1	29.53	3.95	8-40
PAQ2	31.76	5.09	8-40
PAQ3	23.29	4.57	8-40

B. I also asked you to reflect on whether you think:

-- your “intelligence” would be more described as “**convergent**” or “**divergent**”, and how you came to this conclusion (based on the intelligence and creativity tests demonstrated in class).

-- are you more impulsive or reflective

-- are you more field dependent or independent

-- your Keirsey profile

The entire document must conform to APA format including references where appropriate when referring to dimensions of the measures/theories. Don’t forget to paperclip and not staple.
